PosiStrut® Floor System

INTRODUCTION

PosiStrut® range of products are parallel chord trusses using timber chords “on flat” and the unique PosiStrut® metal webs.

PosiTruss is a made to order parallel chorded truss commonly used as long span floor joists. They provide an economical and high quality floor structure which is easily assembled and provides excellent access for plumbing, electrical services and air conditioning ducts. PosiTruss may also be used for long span rafters or purlins to carry tile or steel deck roofing.

As PosiTrusses are designed and manufactured to order for specific projects, they can incorporate internal beams and special support conditions.

PosiJoist® and PosiPlus® trusses incorporate special trimmable ends and are available ex stock. PosiJoist® and PosiPlus® are designed specifically for use as floor joists in domestic type structures and should not be used for other applications without advice from a qualified engineer.

The PosiStrut® range of products are available in nominal 200, 250, 300 and 400mm depth. Actual overall truss depth depends on timber sizes used for the chords, and is provided in the design tables enclosed. PosiStruts® make more efficient use of timber than conventional joists, as they have timber concentrated at the top and bottom of the truss where it works most efficiently. This concept is similar to that of steel universal beams, where the majority of steel is located in the flanges. The efficient use of timber, combined with the strength of the PosiStrut® webs, make the PosiStrut® range of products very lightweight, yet strong structural members.

ADVANTAGES

PosiStruts® offer the following advantages over solid joists:

- Plumbing, electrical conduit and other services can be run between chords and webs.
- No drilling or notching required to accommodate services.
- Additional width available for fixing flooring.
- Ceiling material can be fixed directly to the truss bottom chords.
- Larger clear spans.
- Internal load bearing walls, piers or stumps and bearers can be reduced or eliminated.
- Shrinkage problems sometimes encountered with unseasoned solid timber are reduced or eliminated.
- Lightweight and easy to handle.
- PosiJoist® and PosiPlus® trusses may be trimmed to length on site.
- Load sharing ability.
- Strongback bracing increases floor stiffness and reduces squeaky floors.
- Optional top chord support reduces on-site labour.
- With Posi-Purlins, roof and ceiling can be fixed direct.
- Top chord hanging.

DEFINITIONS

Loadbearing Partition Walls - walls which carry roof and/or upper floor loads in addition to their own self weight and wall lining.

Non-Load bearing Partition Walls - walls which impart self weight only to supporting structure.

Platform Flooring - flooring fitted continuously from external wall to external wall prior to the installation of internal partition walls.

Fitted Flooring - flooring fitted for each room after internal walls have been installed.

Strongbacks - bracing members running at right angles to PosiStruts® which provide load sharing between adjacent members.

LSD - Limit State Design.

FLOOR STIFFNESS

The dynamic response of floor systems to foot traffic and other moving loads is dependant on many factors such as the floor plan of supported walls, applied load, furniture layout, etc. The comfort and expectations of occupants also varies widely and is very personal.

PosiStruts® have been designed so that the maximum span recommended in Tables 1 to 8 conforms to the vibration standard set out in AS1684.1-2006, Residential Timber-Framed Construction, Part 1 - design criteria.

When selecting a PosiStrut® for your application consideration should be given to the springiness of the floor. Generally the floor stiffness provided by the Tables meets the expectations of most occupants. Where PosiStruts® are near their maximum span for large open areas like rumpus rooms and family rooms, or where additional floor stiffness is required the maximum spans given in Tables 1 to 8 should be reduced.

FLOOR LOADING

PosiStruts® have been designed for the following Dead and Live Loads.

Dead Loads - are due to the mass of the structure and permanent fixtures. An allowance has been made in these designs for the following permanent loads:

Flooring - 22mm Particle board flooring or equivalent plywood.

Ceiling - 13mm plasterboard direct or 10 mm plasterboard on battens.

Floor covering - normal floor covering loads e.g. carpets or vinyl tiles. If, clay or heavy ceramic tiles are to be used, on large areas (i.e. greater than 3 square metres), further professional advice should be sought before commencing construction.

Live Loads - are temporary loads due to furniture or people which may vary over time.

PosiStrut® floor systems in this manual have been designed for the following live loads:

Domestic floors = 1.5kPa / 1.8kN

Hospital wards and hotel rooms = 2.0kPa / 1.8kN

Offices for general use = 3.0kPa / 2.7kN

Assembly areas without seating such as concert halls, bars, public lounges = 5.0kPa / 3.5kN

Note: 1. The PosiStrut® span chart in the tables, are not designed to support load bearing walls. All roof loads to be supported by external wall only. For PosiStruts® that must support load bearing walls, contact your nearest MiTek office.

2. All charts have been designed using LSD methods.

3. Minimum Joint Group JD5.

#Important Note: For spans in the range of 600 to 2600, top chords should be a minimum grade of F8 or MGP12 to conform to AS1720.1-1997.

Note: Sections on top chord support, stair openings, cantilevers and load bearing walls do not apply to Span Charts for Commercial Loads.

SUPPORTING STRUCTURE

The supporting structure should be checked to ensure that beams, walls and footings are capable of supporting all loads from floors and/or roof.

As PosiStruts® allow the use of large open areas with fewer bracing walls, the stability of the structure should be checked in all cases.

1. Solid Brick Construction

Lateral stability and strength of supporting walls should be checked in accordance with Masonry Code AS3700-1998.

2. Timber Framed Construction

The strength and bracing of timber framed walls supporting PosiStruts® should be checked using SAA Timber Framing Code AS1684-2006 or be designed using AS1720.1-1997.

3. Elevated Building

For traditional elevated buildings where a central row of piers is to be removed, additional bracing may be required to provide stability to the building. This may be provided by designing ground level shear walls at each end of the building, or by using braced partition walls located centrally. If in doubt, consult MiTek Australia Ltd.

In all of the above cases the stability of the structure relies to some extent on the bracing provided by the panel flooring. For this reason it is important that floor trusses be fixed securely to supporting walls.

All cross walls and end walls should be securely fastened to the outer supporting walls. For timber framed walls use a 50 x 100 mm Strapnail at each intersection. For masonry construction, a continuous timber top plate should be installed and joined to each intersecting top plate at cross walls using 50 x 100 mm Strapnails.

HANDLING AND STORAGE

All PosiStrut® components should be strapped and stacked vertically with the bottom chord clear of the ground, supported on bearers located directly under web points. PosiStruts® may be stacked on top of each other with bearers aligned as closely as possible to web panel points.

PosiStruts® should not be left exposed to weather for extended periods of time without adequate protection. If covered, ensure adequate air circulation around the trusses.

Bearers as close as possible to web points.

Bearers directly under web points.

Bearers as close as possible to web points.

Bearers directly under web points.

Typical stacking of PosiStruts®

Care should be taken when handling the PosiStrut® to avoid bending, twisting or dropping. Slings should always

be attached to the timber chords, and not to the metal webs to avoid buckling.

When lifting PosiStruts® with a crane, slings should be attached at panel points closest to the truss quarter points. See diagram.

The maximum load of sheet materials temporary stored on the PosiStruts is 250kg/m² and should not be greater than 300mm deep. This equates to 15 sheets of 19mm particle board, 13 sheets of 22mm particle board or 23 sheets of 13mm plasterboard. Where the sheets are stacked by hand they should span lengthways across the joists, (Fig. 1). When lifted mechanically they should be seated on 5 bearers the width of which are 600mm longer than the width of the board, (Figs. 2 & 3).

Fig. 1

Fig. 2

Fig. 3

SET OUT AND PLACEMENT

PosiStruts® are generally placed perpendicular to load bearing supporting walls and should be located so that distance between them does not exceed the designed spacing.

Care should be taken to place the PosiStruts® the right way up. Unless marked otherwise PosiStruts® are always manufactured so that Posi-Web starts at the top chord at each support point. There are occasions where it is necessary to design and manufacture PosiStruts® with the first web starting at bottom chord level. In this case trusses will be marked "THIS WAY UP".

TRIMMING ON SITE

Only PosiPlus® and PosiJoist® members can be trimmed to length on site. PosiTrusses are required to be manufactured to the required span for each project. Under no circumstances should PosiTrusses be cut or modified in any way without prior approval from the truss fabricator.

Trimming limitations for PosiJoist®

PosiJoists® within the limits specified below may be trimmed each end by up to 335 mm for PJ20, PJ25 and PJ30 and up to 430mm for PJ40. **PosiJoists® should only be cut at locations between vertical webs.** The following procedure will allow trimming of PosiJoists® to match your exact span.

- Where a supporting wall is to provide support to two abutting PosiJoists®, position PosiJoists® first so that there is equal bearing for each PosiJoist®. Also ensure that there is a vertical member located over the supporting wall.
- Check opposite support to ensure that a vertical timber web is also located over the support (allowable misplacement 5mm). Adjust location of truss until it is possible to trim without cutting through verticals.
- Use the first PosiJoist® as template for remaining trusses.

Note: Do not cut through vertical webs. It should only be necessary to cut at a position between vertical members.

Trimming limitations for PosiPlus®

PosiPlus® members may be trimmed at either end to within a minimum distance of 90mm from the PosiStrut® web.

SUPPORTING EXTERNAL WALLS

CASE 1. Upper Storey of 2 Storey - for the upper storey of two storey construction, where the lower stud wall provides continuous support, and where wall plates and lintels have been sized in accordance with AS1684 lower storey load bearing walls, standard PosiStruts® may be used to support upper walls where the effective length of roof supported does not exceed that given in Table 9. below.

PosiStrut® or PosiJoist® Size	Sheet Roof (mm)	Tile Roof (mm)
PSW3520	5,050	3,950
PSW3525	5,550	4,350
PSW3530	6,750	5,300
PSW4525	8,150	6,100
PSW4530	9,000	6,750
PSW4540	7,450	5,600

Note: The above table has been determined for sheet roof at 900mm centres and tiled roof at 600mm centres with maximum 25° roof pitch.

Where effective length of roof supported is greater than those in Table 9, F-Frame as specified below, solid bearer or standard PosiStrut® with timber verticals inserted under studs may be used.

F-Frame manufacturing details

The sizes and grades of top and bottom chord of the F-Frame can be determined as per wall plates from AS1684 by adopting the vertical strut as stud spacing. Vertical struts do not necessarily have to line up with common studs if the wall plates have been designed accordingly.

Where there are larger openings in the upper storey wall which cause a concentrated load on the PosiStrut® or F-Frame, a suitable timber vertical member should be inserted between the top and bottom chord under the point load to transfer it down to the wall below.

- Note:** 1. PosiStrut® chords and F-Frame chords may be considered to act in conjunction with wall plates to form a double plate or ribbon plate.
2. Where openings are positioned in end walls, lintels are to be sized in accordance with AS1684.

End wall - Upper Storey

SECTION X-X

WARNING

Where stair wells or other voids are located adjacent external walls, the stability of the external wall should be checked by a structural engineer.

Generally, F-frames may be used to support upper walls of two storey construction at end walls where floor and ceiling acts as a diaphragm to restrain the external wall against lateral loads.

However, F-frames should not be used whenever supporting external walls that have an opening for a void area or staircase as shown. In these cases, the external walls are required to be designed by a structural engineer.

CASE 2. Single Storey - for a single storey construction where continuous support for the end F-Frame is not available, frames using PosiJoist® detail may be used provided the roof load (EL) does not exceed that specified in Table 10, and that pier spacing does not exceed 1200 centres.

PosiJoist® End Size	Sheet Roof (mm)	Tiled Roof (mm)
PJE25	7200	3600
PJE30	7200	3600
PJE40	7200	3600

Where the effective length of roof supported exceeds that specified in Table 10, use either solid timber or laminated ConstructaBeams to support end wall and roof loads. Bearer sizes to be taken from AS1684-2006, relevant State Timber Framing Code or refer Gang-Nail Span Charts for laminated ConstructaBeams or AutoBeam.

End wall - Single Storey

$$EL = 2 \times \text{Overhang} + \text{Truss Span}$$

PosiJoist END 25 (PJE25)

PosiJoist END 30 (PJE30)

PosiJoist END 40 (PJE40)

CASE 3. Building with Hip Ends - Both of the above two cases apply, provided the truncated girder truss station does not exceed the effective length of roof supported specified in Table 9.

End wall - Building with Hip End Upper Storey of 2 storey

EL = Truncated Girder Truss Station + 2 x Overhang

CASE 4. End Walls for Single Storey Buildings with Hip Roof - As for case 2 except EL = Truncated Girder Station.

End wall - Building with Hip End Single Storey

EL = Truncated Girder Truss Station + 2 x Overhang

CASE 5. End Walls for Buildings with Gable Roof - Similar to that of building with Hip End, except the effective length of roof supported is as follows:

EL = 2 x Verge Overhang + Truss Spacing

SUPPORTING NON-LOAD BEARING WALLS

Walls Perpendicular to PosiStruts®

Walls placed perpendicular to the PosiStruts® require no additional support. However, for braced walls with bracing capacity of up to 3.0 kN/m and 2700mm high, fix each end of bracing wall using 2/90 x 35 F5 under battens with M10 bolt and washer.

Braced walls perpendicular to trusses with bracing capacity up to 3.0 kN/m

Bracing walls parallel to trusses with bracing capacity up to 3.0 kN/m

Walls Parallel to PosiStruts®

a) Platform Flooring

Walls placed parallel to the PosiStruts® do not require additional support where a platform floor is to be used and the flooring material is capable of supporting walls. However, for braced walls with bracing capacity of up to 3.0 kN/m and 2700mm high, fix each end of bracing wall using 2/90 x 35 F5 under battens with M10 bolt and washer.

Under batten fixing detail

b) Fitted Flooring

Where flooring is fitted to each room after internal walls have been constructed, an additional truss is required below the wall to provide support to both the wall and flooring.

Fitted Flooring

Double trusses used under non-load bearing internal partition walls should be located such that the partition is bearing equally on both trusses. Flooring and strong-backs should be fixed to both trusses.

SUPPORT DETAILS

PosiStrut® Bottom Chord Support

PosiStruts® may be supported on their bottom chord as shown

PosiStrut® Top Chord Support

The maximum span of top chord supported PosiStruts® may be increased to the maximum span of the bottom chord trusses, if the end vertical web is fastened to the supporting beam with Gang-Nail Trip-L-Grips or if one of the following details are used:

1. Double end vertical web - see Figure 'X'.
2. Timber End Block - see Figure 'Y'.

Figure 'X'

Recommended Timber Blocking Sizes				
PosiStrut Depth	200	250	300	400
Strongback Size	90 x 35	120 x 35	140 x 35	190 x 35

Timber End Block for Top Chord Supported PosiStruts®

Figure 'Y'.

PosiJoist® Bottom Chord Support

PosiJoists® should only be supported on their bottom chord as shown.

PosiPlus® Bottom Chord Support

PosiJoist® Top Chord Support

Where it is necessary to support PosiJoists® by the top chord as shown, Trip-L-Grip's are required to fasten the truss end vertical web to face of the supporting beam

Hangers for Floor Trusses

Floor trusses may be supported by Joist Hangers or I-Beam Hangers in accordance with MiTek 20/20 fixing schedule.

FIXING AND CONNECTIONS

Fixing to External Walls

Each PosiTruss® to be fixed onto the supporting structure by a minimum of 2/3.15mm diameter x 75mm long nails. For wind classification areas higher than N2 refer to AS1684 for details.

PosiStrut®

PosiJoist®

Fixing to Internal Walls

When PosiStruts® are to be supported by internal walls place PosiStruts® side by side and fix as above or butt together using a 50 x 100mm Strapnail to connect PosiStruts®.

Support of Internal Load Bearing Walls

PosiStruts® are generally not designed to support load bearing internal walls, however where there is a supporting wall directly below, PosiJoist® and PosiPlus® trusses should be strengthened as illustrated below.

Fixing to Internal Walls

a) Non-bracing wall

If internal walls are not designed as bracing walls, fix the truss with the INTERNAL WALL BRACKET with nails at the top of the slots to allow for truss settlement as it is loaded. Brackets are fixed at 1.8m centres along unsupported sections of the wall. Where trusses are parallel to walls, trim between the bottom chords and fix brackets to the trimmer. Where internal walls are stable in their own right, no Internal Wall Brackets are required.

Truss Parallel to Non-Bracing Wall

Truss Perpendicular to Non-Bracing Wall

b) Bracing Wall

Where internal walls are designed as bracing walls, trusses should be fixed to the top plate using structural connections of equivalent strength to the bracing strength of that particular bracing wall. The connection should also allow the truss to deflect vertically when it is loaded.

Truss Parallel to Bracing Wall

Nailing plates or framing anchor (legs not bent) to either end of nogging with 6/2.8mm diameter nails to each face.

Truss Perpendicular to Bracing Wall

Table 11 - Fixing details for Bracing Walls

N - Not Suitable

Fixing to Steel Beam

Note:

1. Size of packers and timber fixing plate to suit steel flange width.
2. Timber fixing plate is to be contained within the steel beam flange so as to restrain any vertical load induced by PosiStrut® trusses.

PosiTruss®

PosiPlus®

Notched PosiPlus® to Steel Beam

Table 12. Timber Blocking Size Required	
PosiPlus®	Timber Blocking Size
PP 250 deep	120 x 35
PP 300 deep	140 x 35

STRONGBACKS

Strongbacks are bracing members running at right angles to PosiStruts®. Strongbacks significantly dampen vibrations and increase the stiffness of the floor system. The performance of the floor depends very much on the proper installation of strongbacks. Strongbacks to be supported off end walls and any internal walls to increase floor stiffness. They should be placed at 2400mm maximum spacing along span of each truss.

Strongbacks must be fixed to the central vertical webs on each PosiStrut® with 3/3.15mm diameter nails and spliced in accordance with details following.

The ends of strongbacks (and wherever internal partitions are crossed) should be anchored to the wall to improve dynamics with nominal fixing as required for ceiling joists in AS1684.

Note:

1. Timber grades for strongback sizes given in the above table to be equivalent to or higher than grade used for PosiStrut® chord sizes.
2. Alternatively a deeper section strongback of a lower grade may be used. Reduce by one grade for each 25mm increase in depth.
3. Table 13 applies to standard design charts in this document only. Where PosiStrut® trusses are custom designed using MiTek20/20 software, strongback sizes specified by MiTek20/20 computations should be used.
4. It is recommended strongbacks be used to align trusses during installation by locating the strongback hard against the underside of truss top chord or top of bottom chord before fixing to timber web or Back Brace.

Table 13. Recommended Strongback Sizes				
PosiStrut Depth	200	250	300	400
Strongback Size	90 x 35	120 x 35	140 x 35	190 x 35

Strongback fixing and splice

Strongback to double truss connection

Alternative strongback splice

Table 14. Splice Plate Sizes			
Strongback Size	Joint Type	GN Plate Type & Size	Tylok Plate Type & Size
90 x 35	Single	GE75150	6T10
120 x 35	Single	GE75150	6T10
140 x 35	Double	GQ50150	6T5
190 x 35	Double	GQ63150	8T7

When strongback location changes, the strongback must run through to the next PosiStrut® and be connected to the side as per detail following.

Connection of strongback to PosiStrut® at change of span

Strongback fixing using Gang-Nail Back Brace bracket

The Back Brace allows the strongback to be fixed at positions other than at timber vertical webs. This enables the strongback to be fixed in a continuous line when there are variations in span.

Note:

1. All screws MiTek 14 gauge x 30mm.
2. Do not over tighten screws.

STAIR OPENINGS

Where openings are required on the upper floor for stairwells, one or more shorter PosiStruts® may be used and supported on headers fixed to adjacent PosiStruts®.

The header beam maybe supported on double PosiStruts® as shown below. For header beam sizes refer Table 15. The connection of the header to the double PosiStrut® is as shown on page 16.

Note that header beams have been designed to carry PosiStrut® floor loads only.

Note:

PosiJoist to be supported by fixing end vertical web as specified on page 11.

PosiPlus® Header Beam Fixing Detail

Table 15. Header Beam Sizes to Support PosiStruts® Only

Shortened Truss Span	Header Beam Span (mm)						
	900	1200	1500	1800	2100	2400	2700
2000	90 x 45 (F5)	90 x 45 (F5)	90 x 45 (F17)	120 x 45 (F8)	140 x 35 (F8)	190 x 35 (F8)	190 x 35 (F8)
3000	90 x 45 (F5)	90 x 45 (F8)	120 x 35 (F8)	140 x 35 (F17)	140 x 35 (F17)	190 x 35 (F8)	190 x 45 (F8)
4000	90 x 45 (F5)	90 x 45 (F17)	120 x 45 (F8)	140 x 45 (F17)	140 x 45 (F17)	190 x 45 (F8)	190 x 45 (F17)
5000	90 x 45 (F5)	90 x 45 (F17)	120 x 35 (F17)	140 x 45 (F17)	190 x 45 (F17)	190 x 45 (F17)	240 x 35 (F17)
6000	90 x 45 (F5)	120 x 35 (F17)	120 x 45 (F17)	140 x 45 (F17)	190 x 45 (F17)	190 x 45 (F17)	240 x 35 (F17)

Illustrated below are some common types of stairwells (refer to Figures 1 to 3). For each diagram there are certain conditions that need to be observed.

For other types of stairwells, and for dimensions greater than those shown in Figures 1 to 3, contact your PosiStrut® supplier.

Figure 1

Figure 2

Figure 3

Note:

1. These double PosiStruts® have been designed to carry header beams which support shorter PosiStruts® only. They will not carry the stairwell itself.
2. Double PosiStruts® have also been designed for 600mm maximum truss centres. Therefore, web layouts of 600mm truss centres should be used.

Table 16. Maximum Spans for double PosiStruts® Case 1 and Case 2 Supporting Header Beam (mm)

	45 x 90	4200	4200	4200

Header Beam Connection

Where double PosiStruts® are supporting header beams, strongbacks are to be fixed to each truss using 4/3.15mm diameter x 75mm long nails.

CANTILEVERS

Non Load Bearing Wall

Cantilevered balconies can be formed using solid timber either fitted into trusses between chords or off to the side of the truss as shown below. The cantilever beam can be sized from timber span charts and should extend back into the building to a distance greater than the balcony length. Balcony cantilevers should be no greater than one fifth of the floor truss span.

For cantilever beams built into PosiStrut® trusses ensure full bearing along top and bottom chord using suitable dry timber packers fixed to both truss and beam with 3.15mm dia. nails at 225mm centres.

For beams supplied separate to trusses, fix to vertical webs with a minimum of 3/3.15mm dia. nails and to the first strongback with 1 Trip-L-Grip. Provide lateral ties to top edge of beam at 600mm centres fixed to beam with 1/3.15mm dia. nail.

Built in cantilever beam.

Lapped and nailed cantilever beam.

Note:

1. Cantilever beam has been designed to carry balcony load only. Size and grade can be obtained from AS1684.
2. If cantilever is exposed to weather, place damp proof course between joist and PosiTruss®.

SECTION Y-Y

Load Bearing Wall

PosiPlus®

Standard PosiPlus® trusses may support an external load bearing wall on a cantilever provided that the cantilever does not exceed 160mm and maximum standard roof truss span does not exceed 12m for both sheet and tile roof. Wall cladding of 30kg/m² maximum is also allowed for.

PosiTruss®

PosiStrut standard outrigger system is recommended for PosiTruss with small cantilevers with the following limitations.

Endwall supporting max 9m span trusses for:

- Tiled roof @ 600 crs.
- Sheet roof @ 900 crs.
- Not for girder loads
- Max. wall height of 2400mm

For girder loads contact MiTek state engineering office.

PosiStrut® Roof Rafter & Purlin System

INTRODUCTION

PosiStrut® rafter and purlin details contained in this manual are only suitable for domestic construction. Although PosiStrut® rafters and purlins provide an economical solution for many commercial and light industrial buildings they need to be specifically designed for each building. For structures other than domestic buildings, consult MiTek Australia Ltd. or a licensed MiTek fabricator.

DEFINITION

PosiStrut® rafters are trusses placed parallel to roof pitch.

PosiStrut® purlins are trusses placed perpendicular to roof pitch.

ROOF LOADING

PosiStrut® rafters and purlins have been designed to allow for the following dead, live and wind loads.

Dead Loads

Dead loads are due to the weight of the roof structure and permanent fixtures. An allowance has been made for the following permanent loads.

1. Roof and ceiling material

- Terracotta tiles and 13mm plaster battened, maximum load 90kg/m²
- Concrete tiles and 13mm plaster battened, maximum load 80kg/m²
- Steel decking and 13mm plaster battened, maximum load 40kg/m²

2. Self weight of PosiStrut® rafters and purlins.

Provision for hot water units and air conditioning units have not been considered, Should there be the need for such services then contact MiTek Australia Ltd. engineers for advice.

Live Loads

Live loads are temporary loads due to maintenance of the roof structure. These loads are in accordance with AS1170.1-1989.

Wind Loads

The PosiStrut® rafters and purlins have been designed to conform to AS1170.2-1989 Wind Loading Code, AS4055-1992 Wind Load for Housing for the maximum design gust wind speed in Table 15.

Table 19. Maximum Design Gust Wind Speed

Wind Classification	Max. Design Gust Wind Speed (m/s)		Pressure coefficient	
	Permissible stress method (V_p)	Ultimate Limit State (V_u)	External (C_{pe})	Internal (C_{pi})
N3	41 (W41N)	50	-0.9	0.2
N4	50 (W50N)	61	-0.9	0.2
C1	41 (W41C)	50	-0.9	0.7

CAMBER

Camber of span/300 or 20mm maximum should be set into each truss.

SET OUT

PosiStrut® rafters and purlins have been designed for 600, 900, 1200, 1500 and 1800mm centres and in no case should the design maximum truss centres be exceeded.

Sizes for battens or purlins used in conjunction with PosiStrut® rafters to be in accordance with AS1684-2006 'Residential Timber-Framed Construction'.

PosiStrut® rafters and purlins used in open carports and garages may have higher criteria. In these situations consult MiTek Australia Ltd. engineers for further advice.

SIZES

The PosiStrut® rafters and purlins are available in four nominal sizes 200, 250, 300 and 400mm depths.

As all PosiStrut® rafters and purlins are made to order, they are produced in the exact length required for the job.

HOLD DOWN DETAILS

Fixing types for various spans, spacing and roof covering are given in Table 20.

For more accurate assessment of hold down requirements on specific projects, refer to MiTek Australia Ltd. engineers.

Details for fixing wall plates to foundations to be by others. The supporting structure must also be designed by others to resist all vertical and horizontal loadings.

Top Chord Support Hold Down Detail

Bottom Chord Support Hold Down Detail

END AND INTERNAL SUPPORT BRACING

At external and internal supports, PosiStrut® rafters and purlins should be braced back to the top plate with the following:

1. Timber Diagonal Bracing (TDB) at 1200mm centres recommended for PS30 and PS40

2. Plywood Bracing Frame (PBF) at 2400mm centres.

3. Gang-Nail Speedbrace (SB) at 2400mm centres.

Note:

For top chord supported PosiStrut® trusses end panel bracing may be omitted if end web is fastened to end wall at bottom chord level.

HERRINGBONE BRACING

Use of Gang-Nail Bracing Strap to connect the top chord of one PosiStrut® to the bottom chord of the adjacent PosiStrut®. This type of bracing is to run continuously through the PosiStrut® trusses. Refer to detail below.

Herringbone bracing to be at least 3000mm maximum centres. For spans less than 3000mm herringbone bracing is not required.

For PS40 PosiStrut® trusses herringbone bracing should be spaced at 1800mm maximum centres.

**MAXIMUM SPAN CHARTS****Note:**

1. All charts designed using LSD design method.
2. Minimum Joint Group JD5.

PERMANENT BRACING

These recommendations provide for:

- a) Wind Classification areas N4 and C1.
- b) Walls being stable in their own right.
- c) Roof spans as per Tables 17 to 21.
- d) Maximum truss centres - 1200mm for tiled and 1800mm for sheet roof.

LATERAL RESTRAINT**Top Chord**

For roofing battens or roofing purlins use sizes as required by AS1684 National Timber Framing Code, at 900mm maximum centres.

Bottom Chord

For ceiling battens or ceiling joists use sizes as required by AS1684 Residential Timber-Framed Construction at 900mm maximum centres.

For suspended ceilings or where ceiling battens do not provide restraint to bottom chords, eg. metal furring channels clipped to trusses, bottom chord ties may be required. Use 50 x 25 (F5) ties for trusses up to and including 900mm centres, and 70 x 35 (F5) ties for trusses at up to 1800mm centres. Fix ties to each truss with one 3.75mm diameter nail. Splice by lapping over adjacent trusses.

Table 21. PosiStrut® Rafter & Purlin Maximum Spans

Maximum Raked Span for Domestic Roof Loading

SPEEDBRACE FIXING

ROOF BRACING - PosiStrut Rafters - Trusses are placed parallel to roof pitch.

Top Chord Bracing

The top chord bracing shall be arranged according to the following roof lengths using single Speedbrace:

Note:

The following bracing details are designed for the stability of PosiStrut® truss only. The stability of supporting and end walls should be checked by others.

a) Roof length 'L' is less than truss span 'S'

Where the roof length 'L' is very short compared to the span 'S' such that it would result in a brace angle greater than 45°, a diagonal bracing arrangement is required as given below. Bracing bays should be spaced across the roof such that the angle is always between 30° and 45°.

b) Roof length 'L' is 1 to 1.5 times the truss span 'S'

c) Roof length 'L' is long compared to the truss span 'S'

ROOF BRACING - PosiStrut Purlins - Trusses
are placed perpendicular
to roof pitch.

Top Chord Bracing

The top chord bracing shall be arranged according to the following roof lengths using single Speedbrace:

Note:

The following bracing details are designed for the stability of PosiStrut® truss only. The stability of supporting and end walls should be checked by others.

a) Roof length 'L' is less than truss span 'S'

Where the roof length 'L' is very short compared to the span 'S' such that it would result in a brace angle greater than 45°, a diagonal bracing arrangement is required as given below. Bracing bays should be spaced across the roof such that the angle is always between 30° and 45°.

b) Roof length 'L' is 1 to 1.5 times the truss span 'S'

For PosiStrut purlins with span greater than 4000mm, double Speedbrace shall be used.

c) Roof length 'L' is long compared to the truss span 'S'
